

WarehouseGPT Operations SOP

Purpose of the Operations SOP

This SOP defines standard warehouse operating practices for productivity, labor planning, replenishment, inventory control, service and safety management.

WarehouseGPT retrieves this document when users ask about procedures, escalation or expected operational response.

Workforce Planning SOP

Workforce planning must align forecast volume, actual workload, planned headcount, absence risk and shift productivity.

- Review ForecastVolume and ActualVolume daily.
- Compare overtime by shift and team leader.
- Plan backup labor for high-volume periods.
- Escalate if Overtime_pct exceeds 10 for more than three consecutive days.
- Escalate immediately if Overtime_pct exceeds 15.

Picking Operations SOP

Picking operations must ensure pick waves are released according to capacity, labor availability and service priorities.

- Monitor PickRate and SelectionRate_Cases by shift.
- Investigate if PickRate falls below warning threshold.
- Check replenishment readiness before peak pick waves.
- Review picker assignment and zone balancing.
- Document corrective action if performance remains below target.

Replenishment SOP

Replenishment should prevent stock-outs in pick locations and reduce picker waiting time.

- Monitor ReplenishmentRate and IdleSelectionTime_pct together.
- Escalate if replenishment delay creates idle time above warning threshold.
- Prioritize high-velocity SKUs before peak picking windows.
- Review replenishment queue aging and equipment availability.

Inventory Control SOP

Inventory accuracy must be maintained through cycle counts, discrepancy checks and root-cause tracking.

- Trigger cycle counts when InventoryAccuracy_pct falls below 95.
- Escalate critical issue when InventoryAccuracy_pct falls below 92.

- Review PickingErrorRate_pct when inventory accuracy deteriorates.
- Document stock movement corrections.

Service and Shipment SOP

On-time shipment is a customer-impacting KPI and should be reviewed daily.

- Escalate if OnTimeShipment_pct falls below 95.
- Trigger service recovery plan if OnTimeShipment_pct falls below 90.
- Review order cycle time, capacity utilization and overtime.
- Separate volume-driven issues from productivity-driven issues.

Safety SOP

Safety incidents must be recorded, investigated and assigned corrective actions.

- Review SafetyIncidents by warehouse and shift.
- Escalate immediately if incidents exceed critical threshold.
- Perform safety briefing after recurring incidents.
- Pause risky process if required.

Escalation Matrix

Operational issues should be escalated according to severity and ownership.

- Team Leader: first-level review of daily productivity and idle time.
- Shift Manager: shift-level coordination and workload balancing.
- DC Manager: critical KPI breaches and cross-team action plans.
- Regional Director: recurring multi-site risks and capacity constraints.
- Operations Excellence: best practice sharing and continuous improvement.
